

DP Wizard Tutorial

Getting Started with DP Wizard: A Step-by-Step Guide

Overview

DP Wizard is a browser-based tool that helps you build differentially private analyses without needing to write code. It works by walking you through a user-friendly interface to configure privacy settings and generate a Jupyter notebook that uses the OpenDP Library.

The DP Wizard interface includes the following tabs:

1. About — Learn what DP Wizard does and what it produces.
2. Select Dataset — Upload your private and public CSV datasets.
3. Define Analysis — Choose columns, set epsilon and bounds, configure your analysis.
4. Download Results — Download the generated notebook and other outputs.

You will use these tabs in sequence to configure your analysis.

This tutorial walks you through how to use the tool on a hosted server — no Python installation, virtual environment, or local setup needed.

What You'll Need

- A modern web browser
- Two CSV datasets:
 - Private dataset: [week_data.csv](#)
 - Public (synthetic) dataset: [week_data_synthetic.csv](#)
- [DP Wizard Server Link](#)
- [Notebook Server Link](#)

Workflow

1. Use DP Wizard to create a privacy-preserving analysis and download the Jupyter notebook.
2. Upload the notebook to the provided server and run or edit it — no login required.

Step-by-Step Instructions

1. Launch the DP Wizard

Open [DP Wizard](#)

The screenshot shows the 'Select Dataset' step of the DP Wizard. It has four tabs: 'About', 'Select Dataset' (active), 'Define Analysis', and 'Download Results'. The 'Input CSVs' section contains three paragraphs explaining the choices for Private CSV, Public CSV, or both. Below this are two columns: 'Choose Private CSV' and 'Choose Public CSV'. Each column has a 'Browse...' button and an empty text box. The 'Unit of privacy' section asks 'How many rows of the CSV can one individual contribute to?' and has a 'Contributions' input field with the value '1'. At the bottom, there is a 'Define analysis' button with a right-pointing arrow.

2. Select Your Datasets

- Upload **week_data.csv** as your **private dataset**
- Upload **week_data_synthetic.csv** as your **public dataset**

This screenshot is similar to the previous one but shows the 'week_data.csv' file uploaded to the 'Choose Private CSV' field and the 'week_data_syn' file uploaded to the 'Choose Public CSV' field. The 'Unit of privacy' section remains the same with '1' in the 'Contributions' field. The 'Define analysis' button is still present at the bottom right.

Step 3: Define Analysis

1. Select a column (e.g., VisitorId, Time spent (minutes))
2. Choose Functions: Histogram, Mean, Median (based on task requirements)
3. Set Epsilon: Use $\epsilon = 1$ for the initial configuration (will be modified later).
4. Set Bounds: Adjust lower and upper bounds (e.g., Time spent: min=0, max=1000)
- 5.

Unit of Privacy: Typically set to 1 (one row per person)

6. Estimated Rows: 100, 1000, or 10000 — choose based on known data size or leave default.

7. All the choices on the screenshots are defaults just to show the wizard interface — modify to suit your analysis

[Download Results](#)

4. Download Results

- Click "Download Results"
- Download the .ipynb file to your computer. You may also download the Python script or CSV/text summaries

Download Results

You can download a differentially private version of your data.

Download Results

[Download Results](#)

Download Code

You can download a differentially private version of the code that generated the data.

Download Code

[Download Results](#)

Open [Notebook Server](#)

- Click Upload (top right) and select your notebook
- Run cells or modify as needed
